HMC ONE
AI STRATEGY. BUILT TO SCALE.

PEOPLE ANALYTICS & DATA MODELLING · 856 EMPLOYEES · ONE POWER BI MODEL

People Analytics on One Model

HR numbers lived in separate extracts stitched together with VLOOKUPs. HMC connected them in one Power BI data model, moved every Excel calculation into Power Query (M) and DAX, and built a 12-page dashboard where every chart filters every other.

~~29~~ → **0.8** hours per monthly HR review cycle (indicative)

20 tables
Connected in one model
1 fact + dimensions, CTC, date

0 VLOOKUPs
Left in the working
replaced by relationships, M, DAX

12 pages
Report pages on one model
summary, people, attrition, cost, talent

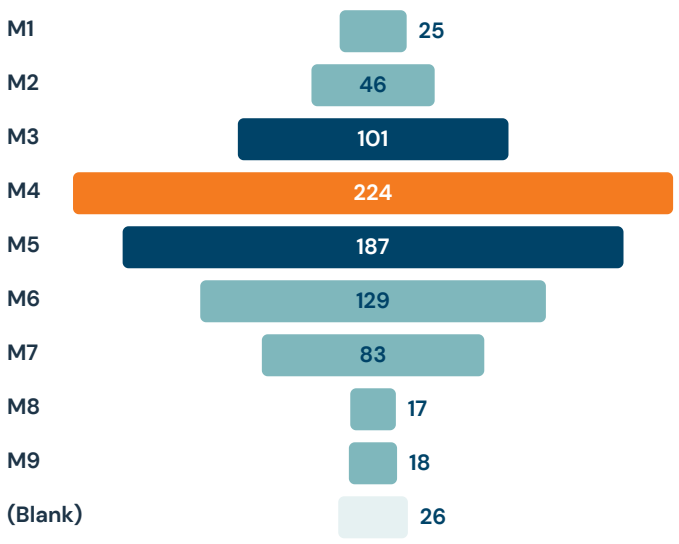

856 active
Employees in the fact table
every visual cross-filters the rest

Rings: one segment per table, the fact table in orange; inner ring is the VLOOKUP share of the old Excel working (16 of 92 objects), outer ring now empty; one segment per report page; 752 men and 104 women. Counts from the Power BI file.

01 The workforce, as the model now sees it

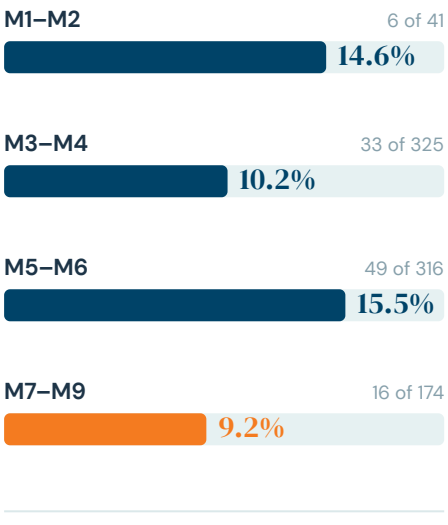

Redrawn from the report's summary and analysis pages

HEADCOUNT BY GRADE

M3–M5: 512 of 856 people (60%)

WOMEN BY GRADE GROUP

Bar scale 0–20% · overall 104 of 856 = 12.15%

856 Headcount
36.48 Average age
22.58% Attrition

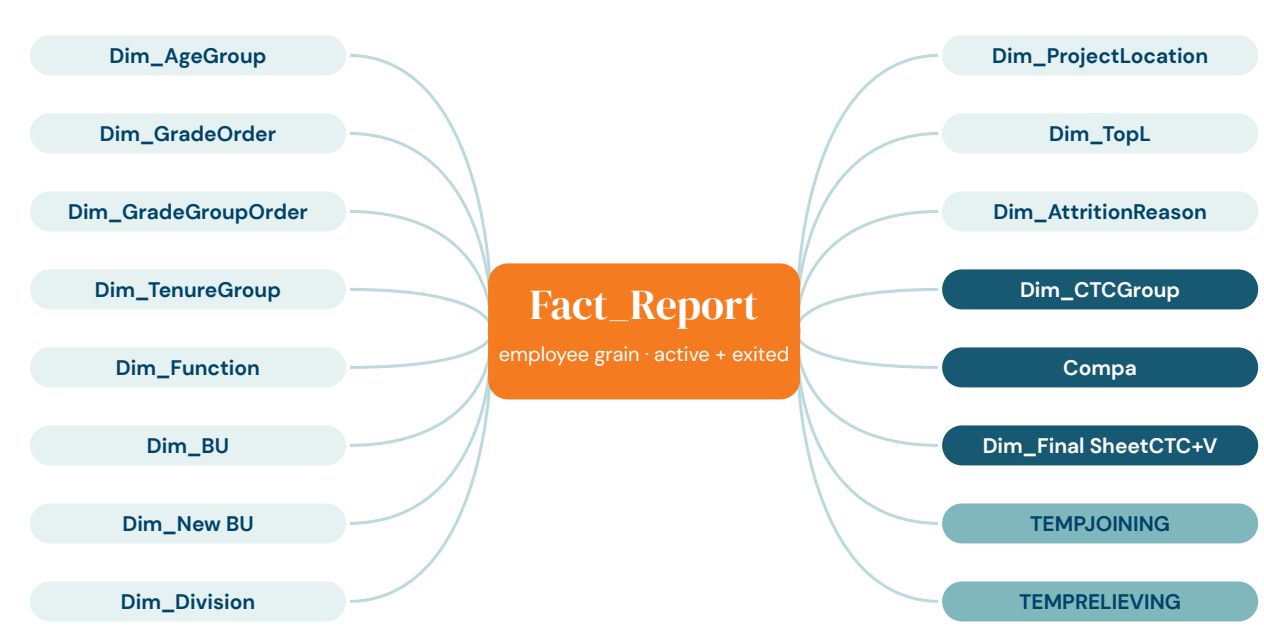

WHAT THE CUT SHOWS
Women thin out at the top
12.15% diversity overall, but 9.2% in M7–M9 and 10.2% in the big M3–M4 band.

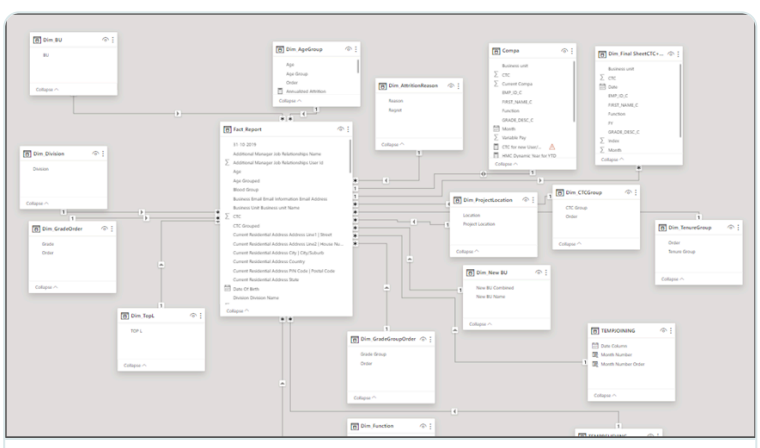

CONCENTRATION
M4 is the centre of gravity
224 people sit in M4; 30–40 year olds (491) and 2–3 years' tenure (360) are the largest bands.

THE POINT
Any cut, one click
"Finance, M4 and above" used to mean a new pivot. Now a slicer on the same model answers it.

02 From a web of VLOOKUPs to a star schema

Tables from the model view · 17 of the 20 shown

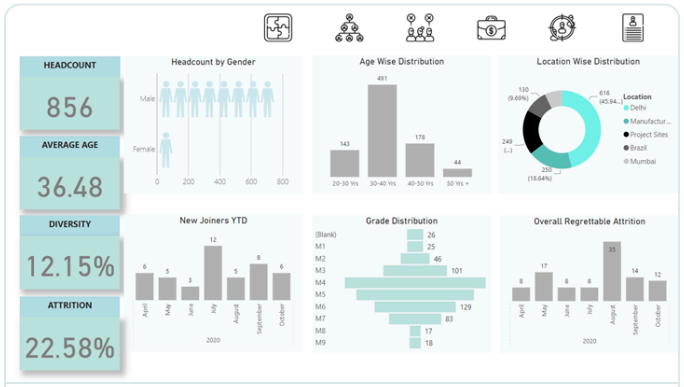

1 **The model view**: Fact_Report at the centre, related to age, attrition reason, BU, CTC, division, grade, tenure, location and date tables

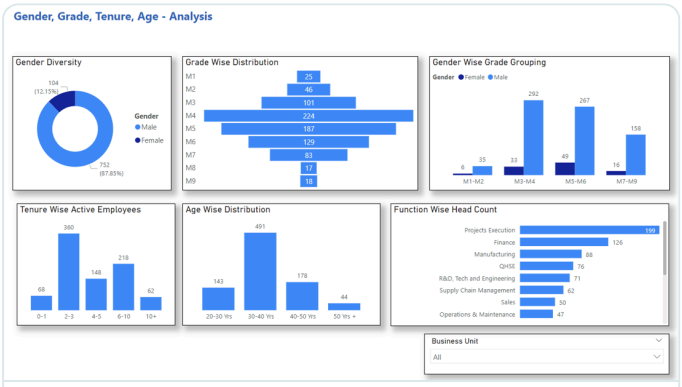

DYNAMIC FISCAL MONTH
HMC_Dynamic Month _ Active Joining
Finds the latest data month and converts it to a fiscal month number, so YTD numbers annualise themselves.

03 The report, as delivered

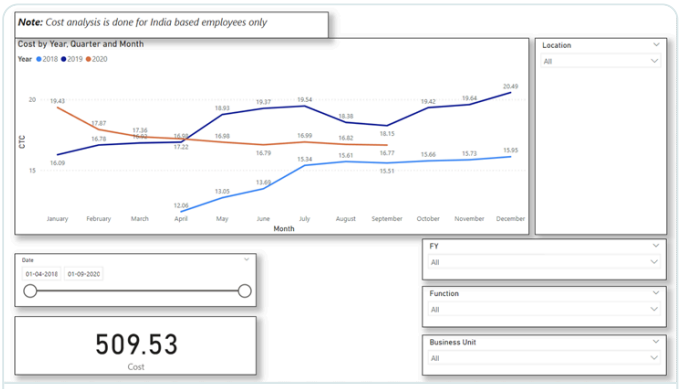

Pages from the Power BI file · one model under every chart

3 **Summary**: headcount 856, average age 36.48, diversity 12.15%, attrition 22.58%

4 **Gender, grade, tenure, age**: 752 men and 104 women, filtered by business unit

5 **Cost**: CTC by month, 2018–2020, India-based employees; total 509.53

04 Four pain points, four fixes

Before → after

BEFORE
Disparate datasets
HRMS extracts, CTC sheets, compa data and joining/relieving trackers, each with its own keys.

STAR SCHEMA

AFTER
One related model
Relationships in one star schema replace VLOOKUP columns across sheets.

BEFORE
VLOOKUP chains
Lookup columns copied down every row: slow, and broken by one inserted column.

POWER QUERY (M)

AFTER
Steps that rerun
Cleaning, typing and derived fields run again on every refresh.

BEFORE
Static charts
Charts did not talk to each other; every new cut meant a new pivot.

DAX MEASURES

AFTER
Cross-filtering
Measures work for any cut, across all 12 pages.

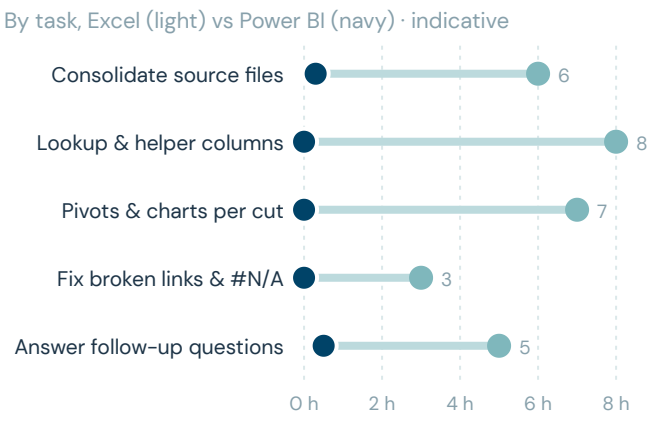

BEFORE
Repeated working
Age bands, tenure groups, fiscal months and attrition redone by hand each cycle.

DYNAMIC FISCAL MONTH

AFTER
Set once
YTD and annualised attrition follow the data automatically.

05 Hours per review

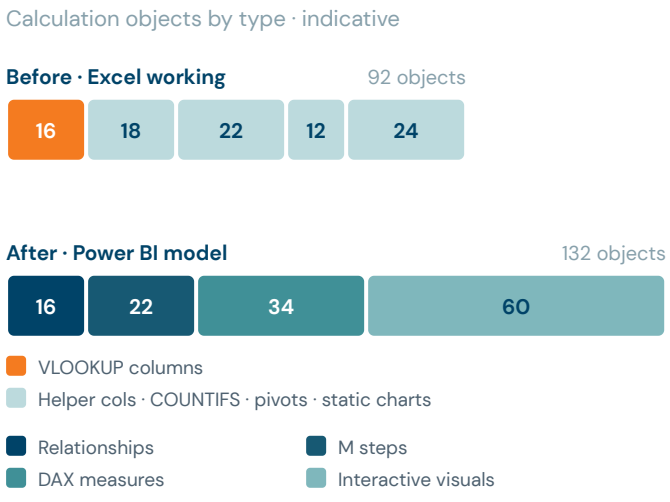

By task, Excel (light) vs Power BI (navy) · indicative

29 → **0.8** hours per review cycle

06 Where the logic lives

Calculation objects by type · indicative

07 How HMC ran it

1 week — **Discover**
Traced the Excel working; catalogued every source, VLOOKUP and helper column.

1 week — **Design**
Star schema: Fact_Report at employee grain, small dimensions with sort orders.

3 weeks — **Build**
M for cleaning, DAX for headcount, diversity, attrition and cost; 12-page report.

2 cycles — **Adopt**
Dashboard replaced the Excel pack; HR team trained to refresh it.

∞ ongoing — **Scale**
New pages reuse the same measures; talent pages added on the model.

What any HR team can borrow

01 — Relate, don't look up
A relationship replaces a VLOOKUP column on every row, and it never breaks when a column moves.

02 — Put logic where it belongs
Shape data in M, calculate in DAX, and leave Excel as a source, not a calculator.

03 — Interactivity is a model feature
Cross-filtering comes free once every chart sits on the same model.
