RURAL SALES FORCE · THREE BUSINESSES · FIVE HIERARCHY LAYERS

# Attrition Analytics

A quarter of a rural sales force was leaving each year. HMC traced exits through every layer of the hierarchy, linked them to targets, and flagged who was likely to leave before the resignation arrived.

~~25%~~ → **19%** annualized attrition after two quarters

**19%**
Annualized attrition after two quarters
▼ from 25%

**−35%**
Exits within 6 months of joining
after onboarding redesign

**60 days**
Early warning on high-risk employees
▲ from "found out at resignation"

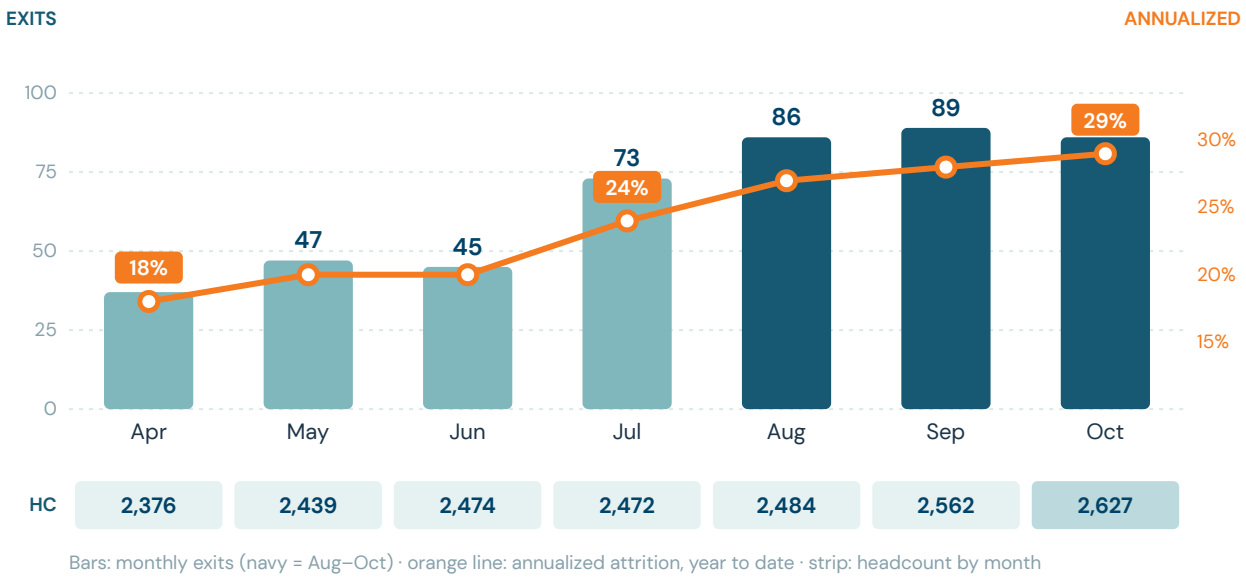

**40%**
Retention budget moved to high-risk segments
▲ from blanket schemes

Rings: attrition now with the earlier 25% inside; under-6-month attrition after (34%) with before (52%) inside; one segment per 30 days of warning; share of retention budget re-targeted. Figures indicative; validated metrics available on request.

## 01 Exits climbing faster than hiring could replace them

April–October · redrawn from the delivered Power BI attrition page

Bars: monthly exits (navy = Aug–Oct) · orange line: annualized attrition, year to date · strip: headcount by month

**SIGNAL**
**Exits more than doubled**
From 37 in April to 86–89 a month by Aug–Oct.

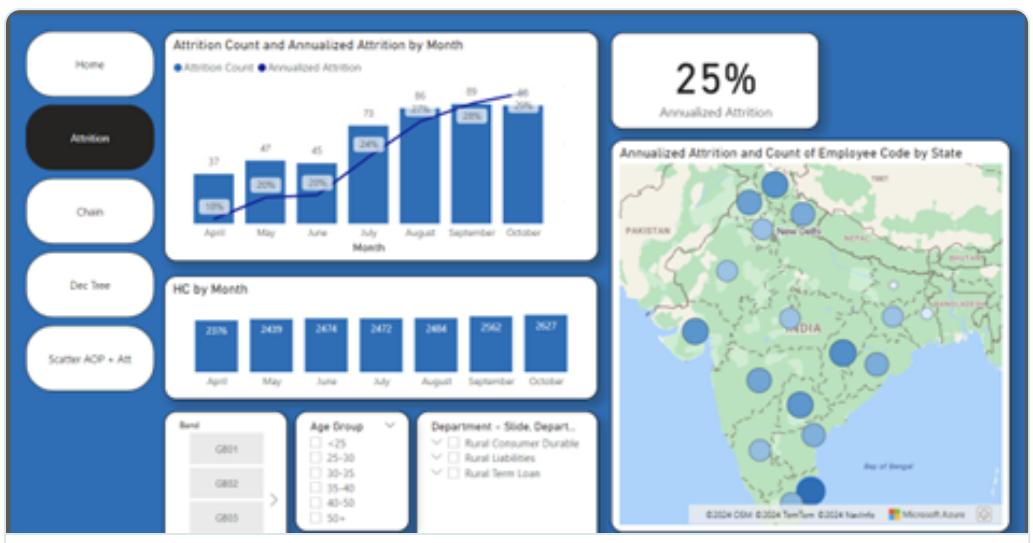

**SIGNAL**
**Annualized attrition 18% → 29%**
The year-to-date rate rose almost every month; the headline card read 25%.

**SIGNAL**
**Hiring just to stand still**
Headcount grew from 2,376 to 2,627: replacement hiring ran just to keep pace.

**THE REAL QUESTION**
**Where are they leaving from?**
One national number hid NSM teams ranging from 15% to 57%+.

## 02 The Power BI report, as delivered

Two of five pages: Home · Attrition · Chain · Decomposition tree · Scatter AOP + Attrition

1 **Attrition page**: exits and annualized attrition by month, headcount by month, state map, slicers for band, age group and department

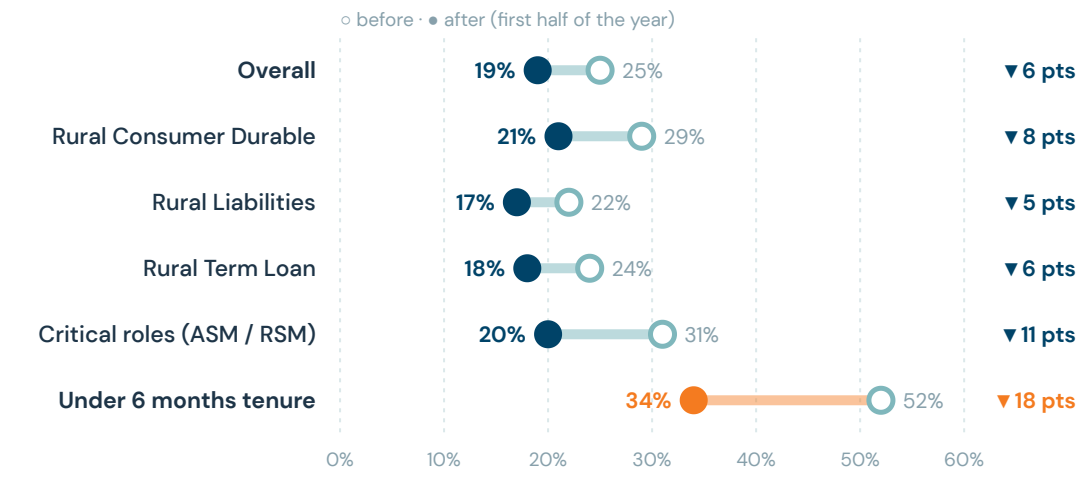

2 **Decomposition tree**: annualized attrition split NSM › ZSM › RSM › ASM, with a department slicer

## 03 Fewer exits where they hurt most

Targeted onboarding, AOP recalibration and focused retention offers

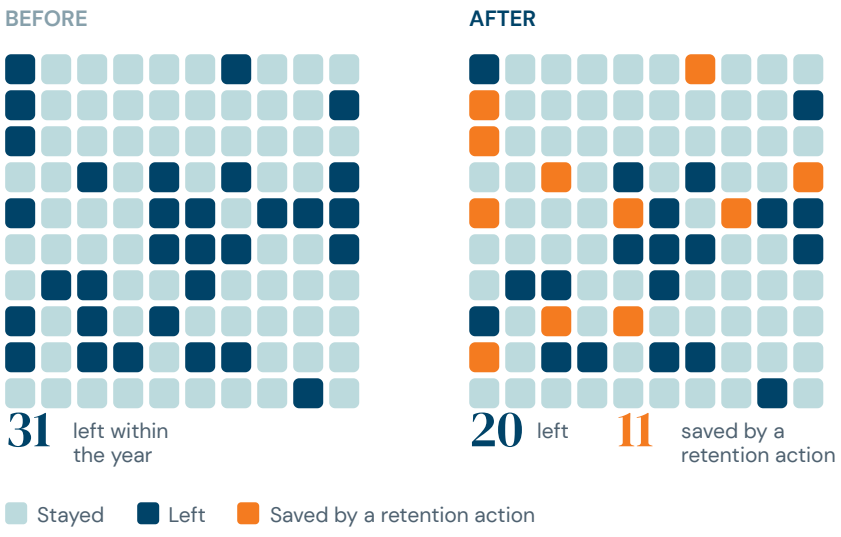

### Annualized attrition by segment

First half of the year, before vs after

### 100 critical-role holders, one year on

High-performing ASMs and RSMs: who stayed and who left

Figures indicative; validated metrics available on request.

## 04 Four pain points, four fixes

How HR and sales manage attrition now

BEFORE
**One number, a month late**
NSM, ZSM, RSM and ASM layers hid where exits clustered.

DECOMPOSITION TREE

AFTER
**Every team, every month**
NSMs and ZSMs review their own tree in the monthly sales review.

BEFORE
**Anecdotes, not causes**
Exit interviews were stories; no one knew what drove exits.

CODED EXIT REASONS

AFTER
**Causes linked to data**
Reasons tied to tenure, targets and managers; under-target territories flagged.

BEFORE
**Found out at resignation**
HR learned someone was leaving when the letter arrived.

PYTHON RISK MODEL

AFTER
**About 60 days' warning**
Every employee scored; HRBPs act on the high-risk list first.

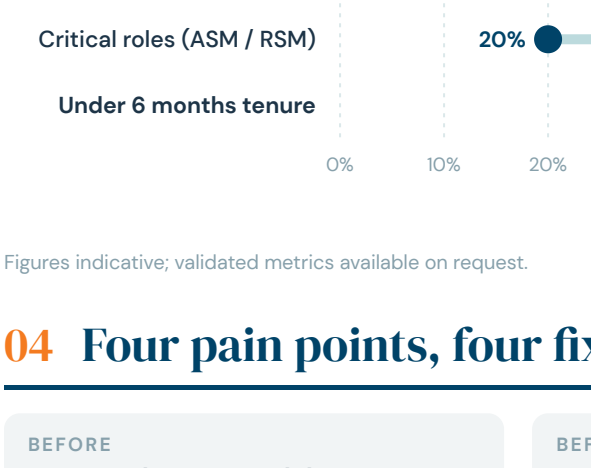

BEFORE
**Generic schemes for all**
Retention money spread evenly, with no view of impact.

SEGMENT PLAYBOOK

AFTER
**Spend follows risk**
Segment-specific actions with cost per head, budget tested before it moves.

## 05 Ten NSM teams

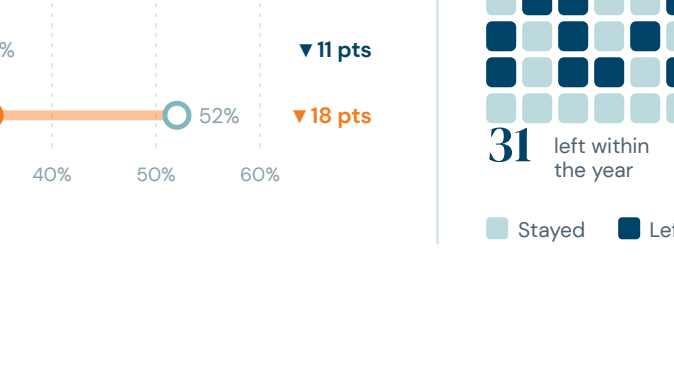

Annualized attrition by NSM, from the delivered tree · names withheld

Teal: below the total · navy: above · orange: 57%+

## 06 One drill path

Following one branch down the delivered tree

A 15% NSM still contains a 32% ASM team: averages hide where people actually leave.

## 07 How HMC ran it

**2 weeks — Discover**
Joined HRMS, exits, bands, tenure; mapped every officer to ASM › NSM.

**2 weeks — Design**
One metric dictionary: annualized and early attrition, AOP at ASM level.

**5 weeks — Build**
Power BI report, risk scores and a segment playbook.

**1 quarter — Adopt**
Attrition joined the sales review; budget allocated by segment.

**∞ ongoing — Scale**
Monthly model refresh; actions tracked against a control group.

## What any sales-led business can borrow

**01 — Attrition is local**
A small share of teams drove a large share of exits. The tree turned a national problem into named teams and named actions.

**02 — Targets and exits move together**
Teams far below AOP lost people fastest, so target setting became a retention lever, not just a sales one.

**03 — Spend where the risk is**
Risk scores let HR fund the right action for the right segment before any money moved.

Built with **Power BI** (DAX, decomposition tree, Azure Maps) · **Python** (pandas, scikit-learn) · **Excel** · HRMS, AOP, survey & exit data | Prepared by Havish M Consulting · Figures indicative; validated metrics available on request.
