HMC ONE
AI STRATEGY. BUILT TO SCALE.

CLIENT CASE STUDY · FINANCIAL SERVICES · SALES

LENDING SALES FORCE · FIVE REGIONS · FOUR PRODUCTS

Sales Productivity Analytics

Fragmented sales data became one clean dataset, every salesperson was segmented by region and product, and a model showed what separates performers from the rest.

~~41%~~ → **47%** performer share of the L2–L3 sales force

248 people
Salespeople segmented (L2–L3)
into 4 performance tiers

47 %
Performer share after conversion
▲ from 41%: 15 converted

73 %
Model accuracy, performer vs not
logistic regression vs 64%

19 cells
Region × product cells diagnosed
5 regions × 4 products

Rings: tier mix of the 248 (non-performer, performer, 100%+); share after conversion with the earlier 41% inside; accuracy with the random forest's 64% inside; one segment per cell.

01 Where performance lives, and where it doesn't

Performer rate by region and product · from the region × product table

Region	BL Business Loan	LAP Loan Against Property	K12 K12 school finance	D2C K12 direct-to-consumer	REGION
South 1	30% 7 of 23	12% 4 of 33	44% 4 of 9	33% 3 of 9	24%
South 2	29% 9 of 31	9% 4 of 46	28% 7 of 25	33% 2 of 6	20%
North 1	17% 7 of 41	13% 3 of 23	19% 3 of 16	0% 0 of 1	16%
North 2	31% 5 of 16	0% 0 of 17	20% 3 of 15	17% 1 of 6	17%
West	36% 20 of 56	11% 4 of 37	27% 3 of 11	not sold	26%
Product	29% overall	10% overall	26% overall	27% overall	

0% — 36% performer rate · Red flag cell · Right column: region total

RED FLAG
North is collapsing
Both North regions sit at 16–17% performers; North 2 has no LAP performer at all.

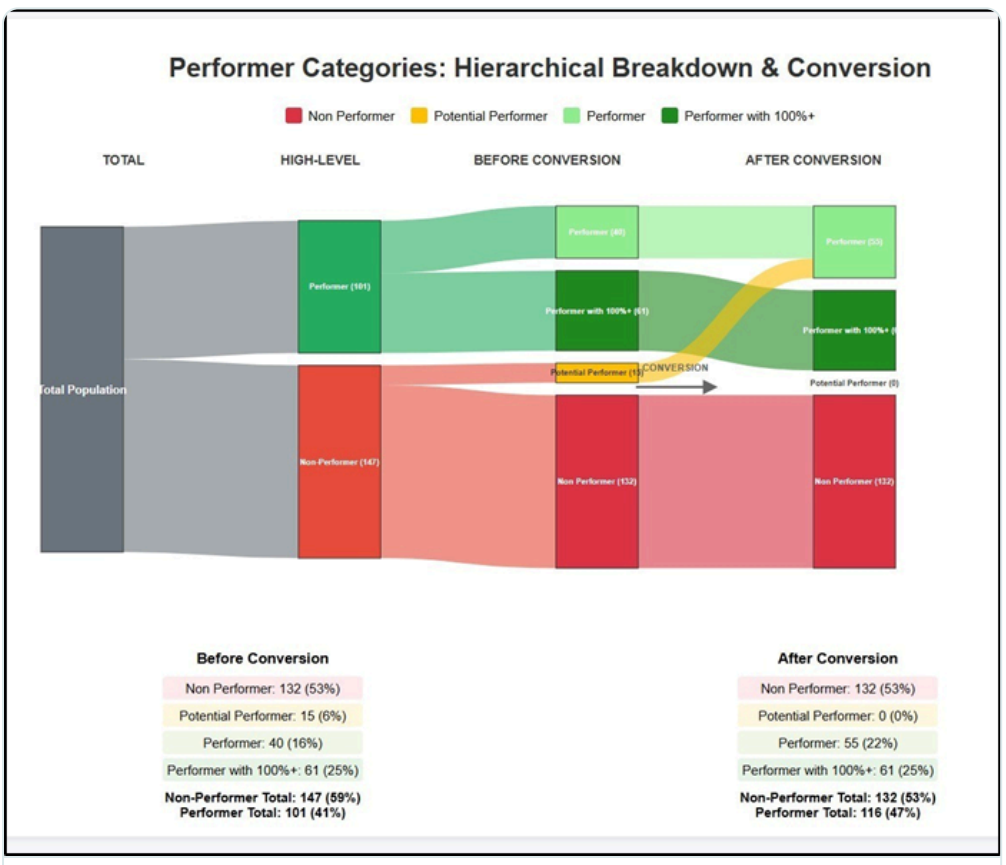

RED FLAG
LAP fails everywhere
About 15 performers across 156 people: 10%, the weakest product in every region.

RED FLAG
South 1 under-used
Large headcount, yet a poor performer yield for its size.

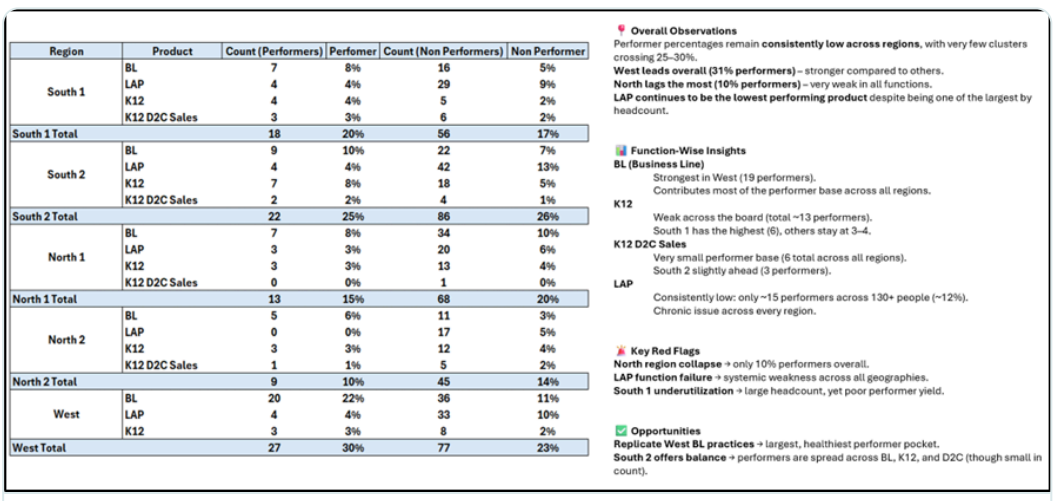

OPPORTUNITY
Copy West Business Loan
20 of 56 performing (36%): the largest, healthiest pocket. Document and replicate.

02 The analysis, as delivered

Actual outputs from the project

1 **Tier flow**: 101 performers become 116 once the 15 potential performers convert

Region	Product	Count (Performers)	Perfomer	Count (Non Performers)	Non Performer
South 1	BL	7	8%	16	5%
	LAP	4	4%	29	9%
	K12	4	4%	5	2%
	K12 D2C Sales	3	3%	6	2%
South 1 Total		18	20%	56	17%
South 2	BL	9	10%	22	7%
	LAP	4	4%	42	13%
	K12	7	8%	18	5%
	K12 D2C Sales	2	2%	4	1%
South 2 Total		22	25%	86	26%
North 1	BL	7	8%	34	10%
	LAP	3	3%	20	6%
	K12	3	3%	13	4%
	K12 D2C Sales	0	0%	1	0%
North 1 Total		13	15%	68	20%
North 2	BL	5	6%	11	3%
	LAP	0	0%	17	5%
	K12	3	3%	12	4%
	K12 D2C Sales	1	1%	5	2%
North 2 Total		9	10%	45	14%
West	BL	20	22%	36	11%
	LAP	4	4%	33	10%
	K12	3	3%	8	2%
West Total		27	30%	77	23%

Overall Observations
Performer percentages remain **consistently low across regions**, with very few clusters crossing 25–30%.
West leads overall (31% performers) – stronger compared to others.
North lags the most (10% performers) – very weak in all functions.
LAP continues to be the lowest performing product despite being one of the largest by headcount.

Function-Wise Insights
BL (Business Line)
Strongest in West (19 performers).
Contributes most of the performer base across all regions.
K12
Weak across the board (total ~13 performers).
South 1 has the highest (6), others stay at 3–4.
K12 D2C Sales
Very small performer base (6 total across all regions).
South 2 slightly ahead (3 performers).
LAP
Consistently low: only ~15 performers across 130+ people (~12%).
Chronic issue across every region.

Key Red Flags
North region collapse → only 10% performers overall.
LAP function failure → systemic weakness across all geographies.
South 1 underutilization → large headcount, yet poor performer yield.

Opportunities
Replicate West BL practices → largest, healthiest performer pocket.
South 2 offers balance → performers are spread across BL, K12, and D2C (though small in count).

2 **Region × product table** with observations, red flags and opportunities

```python
# Key categoricals used in L2-L3 analysis (edit if your column names differ)
cat_cols = [
    "Region",
    "Designation",
    "Age category",
    "Product",
    "Performer/Non Performer (50%)"
]
for c in cat_cols:
    if c in df.columns:
        df[c] = clean_cat(df[c])

# Normalize a few known variants in Performance column (optional)
perf_col = "Performer/Non Performer (50%)"
if perf_col in df.columns:
    df[perf_col] = (
        df[perf_col]
        .str.lower()
        .replace({
            "non performer": "non-performer",
            "non-performer": "non-performer",
            "performer": "performer",
        })
        .str.title()
    )
```

3 **Cleaning in Python**: labels unified

```
Random Forest Model Performance:
Accuracy: 0.64
Precision: 0.62
Recall: 0.66
F1-score: 0.64

Logistic Regression Model Performance:
Accuracy: 0.73
Precision: 0.72
Recall: 0.72
F1-score: 0.72
```

4 **Model scores** on the same split

03 Four pain points, four fixes

Before → after

BEFORE
Unclear performance
No structured way to tell performers from the rest, or how close the middle was.

AFTER
Four tiers
Non, potential, performer and 100%+, agreed before any analysis.
SHARED DEFINITIONS

BEFORE
Messy data
Fragmented files; the same value spelt five different ways.

AFTER
One clean dataset
Trimmed, de-duplicated and standardised, with a data-quality log.
EXCEL · POWER QUERY · PYTHON

BEFORE
Hidden hotspots
Region averages hid which products were failing where.

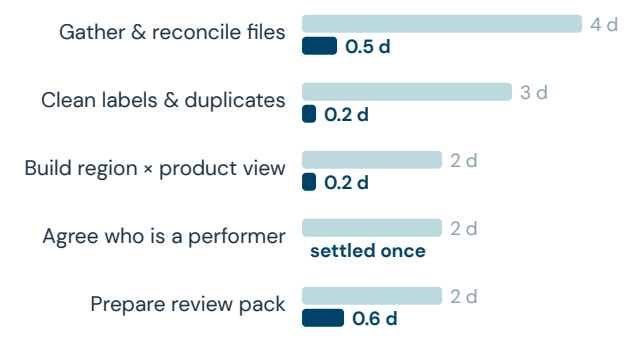

AFTER
Hotspots named
North and LAP flagged; West Business Loan held up as the model.
REGION × PRODUCT CUT

BEFORE
Same push for all
Interventions spread evenly, decided by whoever had the latest file.

AFTER
Potential first
15 potential performers named and coached; weak cells fixed structurally.
TARGETED ACTION

04 Review prep time

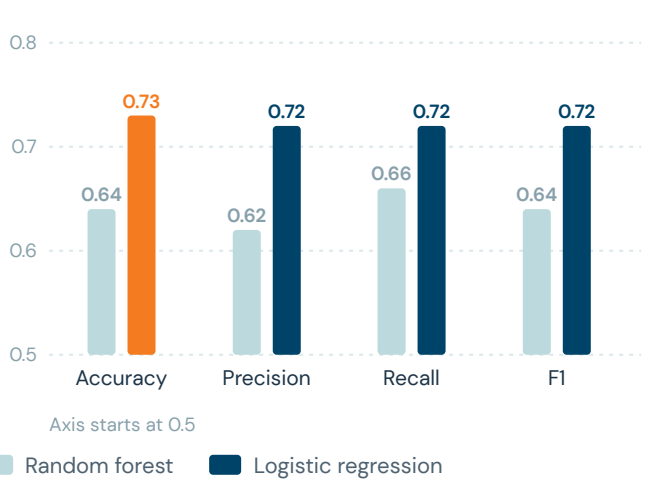

Days per review cycle, before (light) and after (navy) · indicative

13 → **1.5** days per review cycle

05 Which model wins

Same features, same test split

06 How HMC ran it

1 week — **Discover**
Agreed what "performer" means: 50% of target, plus a 100%+ tier.

1 week — **Clean**
Excel and Power Query, then Python for the last mile.

2 weeks — **Analyse**
Segments, tiers, outliers; two models compared.

1 cycle — **Adopt**
Insights taken straight into regional reviews.

∞ ongoing — **Scale**
Pipeline reruns quarterly; model retrained as history grows.

What any sales leader can borrow

01 — Clean first, argue later
Once every label meant one thing, reviews moved from debating numbers to deciding actions.

02 — The middle tier is the quickest win
Fifteen potential performers were the cheapest six points of performer share on the table.

03 — Simple models can win
Logistic regression beat the random forest, and its drivers were easier for leaders to trust.
