Sales Beat Planning

Inherited, memory-built beats were replaced by data-built ones: outlet coverage rose to 91% while travel per beat day fell by nearly a quarter.

~~74%~~ → **91%** outlet coverage per beat cycle

91 %
Outlet coverage per beat cycle
▲ +17 pts vs 74%

86 km
Travel per beat day
▼ 23% vs 112 km

11.6
Productive calls per SO per day
▲ 33% vs 8.7

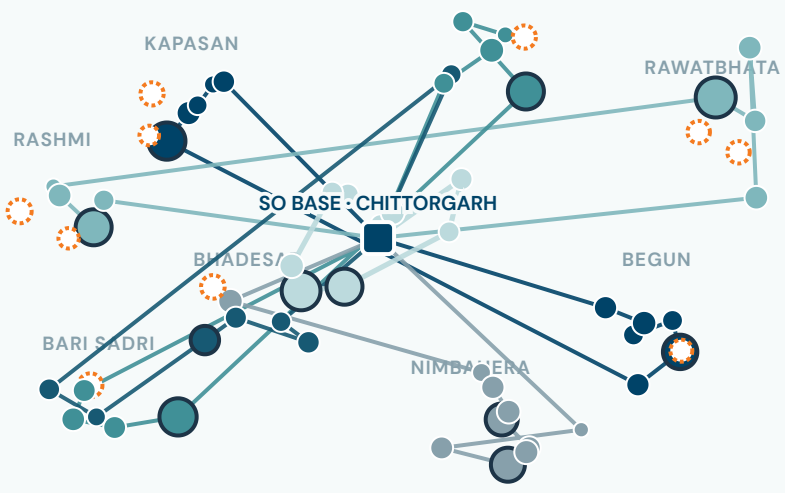

40 min/wk
Beat planning effort per SO
▼ 89% vs 6 hrs

Rings: outer = now, inner = before. Coverage on a 0–100% scale; travel, calls and planning effort scaled to the larger of the two values. Figures indicative; validated metrics available on request.

01 One territory, two beat plans

1 SO · 64 outlets · Mon–Sat cycle · illustrative layout

BEFORE Inherited town-to-day pairings, sequenced by habit

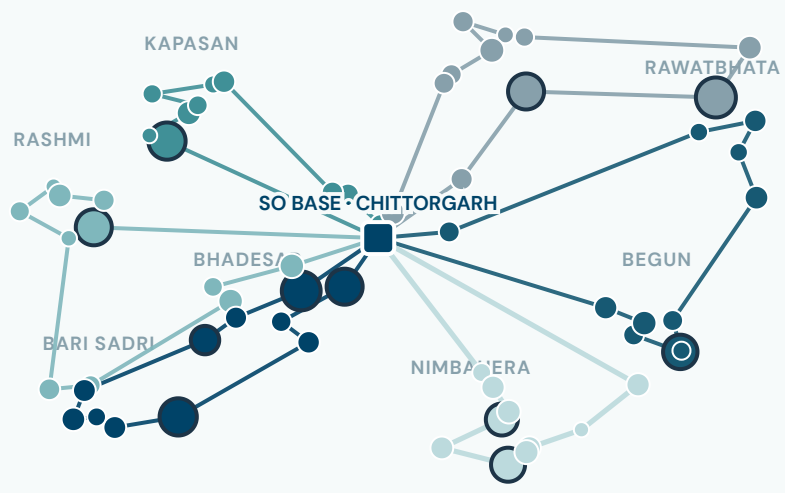

113 km
Avg travel per beat day
Backtracking across towns

54 / 64
Outlets on a beat
10 outlets never visited

95%
Volume potential covered
Mostly C-class retailers missed

AFTER Six contiguous sectors, each day sequenced and untangled

85 km
Avg travel per beat day
▼ 25% vs inherited beat

64 / 64
Outlets on a beat
▲ +10 outlets now visited

100%
Volume potential covered
▲ +5 pts of potential

Mon · Tue · Wed · Thu · Fri · Sat · Not on any beat · Dealer (dot size = potential)

Illustrative layout from seeded sample data, not real outlets. After-beat: sectors around the SO base · nearest-first, then crossings removed · large dealers anchor each route

02 Engine in the back, Excel in the front

Python does the heavy lifting; the SO gets a beat sheet in a format they already trust

SOURCE
DMS / SFA exports
Weekly refresh via a Power Query pipeline

SOURCE
Geo-tagged outlet master
Audited: duplicates, missing geo-tags, inactive counters removed

SOURCE
Local constraints
Haat (market) days, dealer credit-collection days, monsoon access

→

BEAT ENGINE · PYTHON
Cluster, then sequence
- Geography first, balanced by potential so no day is all low-value calls
- Route sequencing to minimise backtracking
- Monthly re-clustering as new retailers are onboarded
- SO overrides logged, not blocked, and fed back into the rules

→

FOR THE SO
Excel / VBA beat sheet
One sheet per SO, per week

FOR ASMS AND RSMS
Power BI adherence dashboard
Weekly adherence by SO, beat and outlet

FOR THE WEEKLY HUDDLE
Claude prompt pack
"What if I move Begun to Thursday?" returns a revised plan with reasoning

The rules of a good beat
Signed off by RSMs before any model was built

CLASS	POTENTIAL / MONTH	VISITS	IN MAP
A	90+ MT	Weekly	11
B	30–89 MT	Fortnightly	36
C	Under 30 MT	Monthly	17

Caps per beat day: outlet count, travel km, and a mandatory dealer anchor.

~6 hrs → ~40 min
Beat planning effort per SO per week

03 Four pain points, four fixes

Before → after

BEFORE
Beats built from memory
Routes passed from one SO to the next; newly onboarded retailers rarely made it onto a beat day.

DATA-BUILT CLUSTERS

AFTER
Refreshed monthly
Clustered by geography and outlet potential, not carried over year to year.

BEFORE
Dealer-heavy, retailer-light
Comfortable counters got repeat visits; outer-village retailers went weeks without a call.

A / B / C CLASSES

AFTER
Potential sets frequency
Outlet class decides visit frequency, not the relationship.

BEFORE
Kilometres, not calls
Zig-zag routes across talukas: 110+ km in a day for eight or nine productive calls.

ROUTE SEQUENCING

AFTER
Nearest-first routes
Backtracking removed; haat days respected.

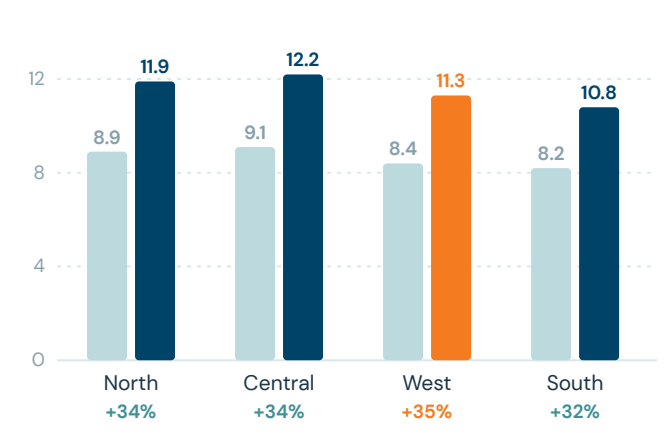

BEFORE
No line of sight
ASMs saw primary sales, not whether the beat was walked; adherence checked via WhatsApp.

POWER BI · HUDDLE

AFTER
Weekly adherence
By SO, beat and outlet, reviewed in a 15-minute weekly huddle.

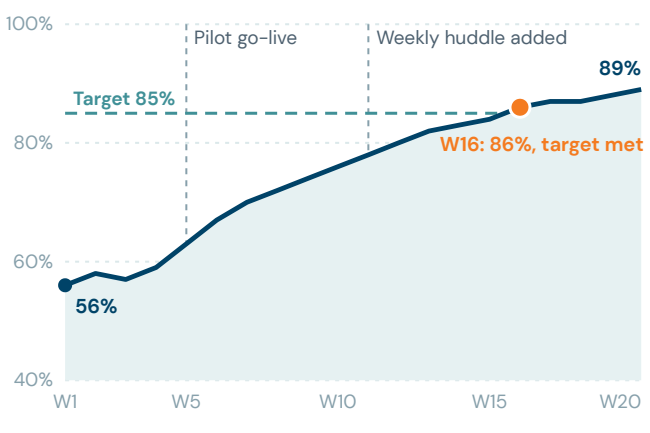

04 More calls, every region

Productive calls / SO / day, quarter before (light) vs after

05 Adherence took hold

% of planned outlet visits completed, weekly, pilot regions

06 How HMC ran it

2 weeks	**Discover** Field rides with SOs in three territories; outlet master audited; baseline scorecard.
2 weeks	**Design** Beat rulebook and A / B / C outlet classification, signed off by RSMs.
3 weeks	**Build** Beat engine, SO beat sheets, adherence dashboard, Claude prompt pack.
4 weeks	**Adopt** Pilot in two regions; weekly huddle playbook; best-adherence SOs recognised.
∞ ongoing	**Scale** Region-by-region rollout; sales MIS trained to run, tune and audit the engine.

What transfers to any field sales team

01
Fix the outlet master first
Geo-tags and outlet classes decided most of the outcome. A clean master beat a clever algorithm.

02
Plan for potential, not just proximity
Visit frequency by outlet class kept clusters commercially honest. Short routes alone can still miss the volume.

03
Ship in the format the field trusts
An Excel beat sheet and a 15-minute weekly huddle drove adoption faster than a new app would have.
