CLIENT CASE STUDY · POWER TRANSMISSION · HUMAN RESOURCES

FUTURE OF WORK · REMOTE WORKPLACE SURVEY · EVERY ROLE SCORED

Remote Readiness

Where should work happen? Managers assessed every role in a validated Excel form, a macro consolidated the returns, and Power BI turned them into a 1–5 remote-readiness score for each role, so the workplace plan followed role need, not preference.

~~82~~ → 9 hours of HR effort per survey round · indicative

52.62% Roles best suited to work from home
26.00% office · 21.38% satellite

3.77 / 5 Average remote-readiness index
range 1.40 to 5.00 across roles

5 factors Weighted factors in the index
infrastructure, meetings, documents, autonomy, supervision

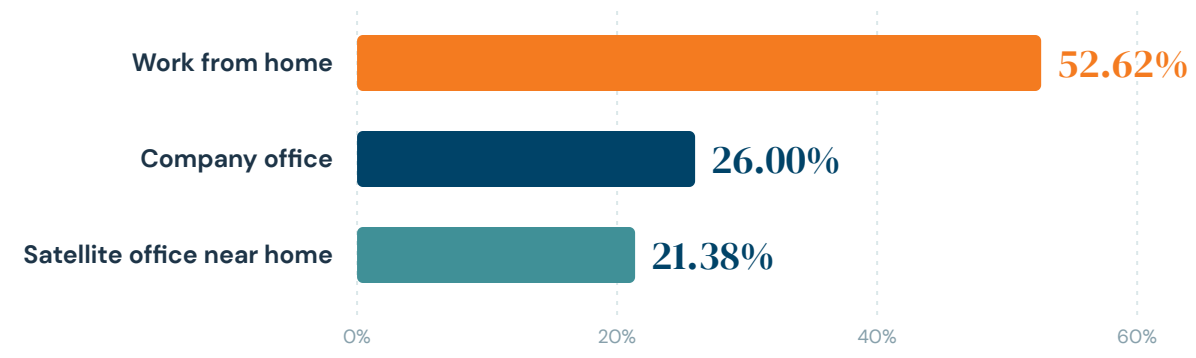

3 stages Tools in one pipeline
VBA form → macro → Power BI

Rings: best-option mix (home, company office, satellite); average index out of 5 with the 1.40 minimum inside; one segment per index factor; one segment per pipeline stage. Figures from the delivered Power BI dashboard.

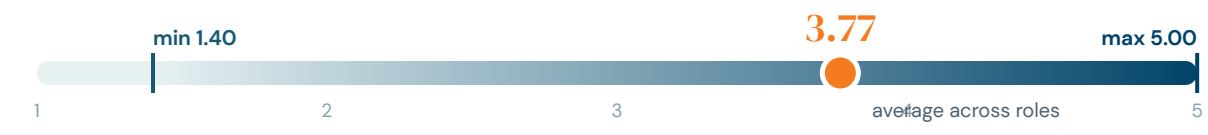

01 Where each role should work

Redrawn from the delivered Power BI dashboard

BEST OPTION · SHARE OF ROLES ASSESSED

REMOTE-READINESS INDEX · 1 (OFFICE-BOUND) TO 5 (FULLY REMOTE)

HEADLINE
Over half of roles can run from home
52.62% of assessed roles came out best suited to work from home; the rest split between the company office and a satellite office near home.

WIDE SPREAD
No one-size answer
Scores ran from 1.40 to a full 5.00: some roles are tied to office infrastructure and in-person meetings, others are fully remote-ready.

MANAGER VIEWS ALONGSIDE
Context next to the score
Ranked future uses of the office, ranked satellite locations, and each manager's estimate of how much of the function can work from home.

DECISION
Role-need-led, not preference-led
The dashboard drove the workplace recommendation pack, with option mix by BU, function and grade.

02 How a role becomes one score

The five factors managers rated for each team member (Section 02 of the survey)

F1 Office infrastructure
Share of the role that needs critical office infrastructure
5 4 3 2 1
5 = 0–20%
1 = 81–100%

F2 In-person meetings
In-person meetings with customers, stakeholders, teams
5 4 3 2 1
5 = 0–20%
1 = 81–100%

F3 Confidential documents
Handling confidential physical documents
5 4 3 2 1
5 = Never
1 = Always

F4 Works independently
The individual can work independently
5 4 3 2 1
5 = Strongly agree
1 = Strongly disagree

F5 Close supervision
Work requiring close supervision
5 4 3 2 1
5 = Never
1 = Always

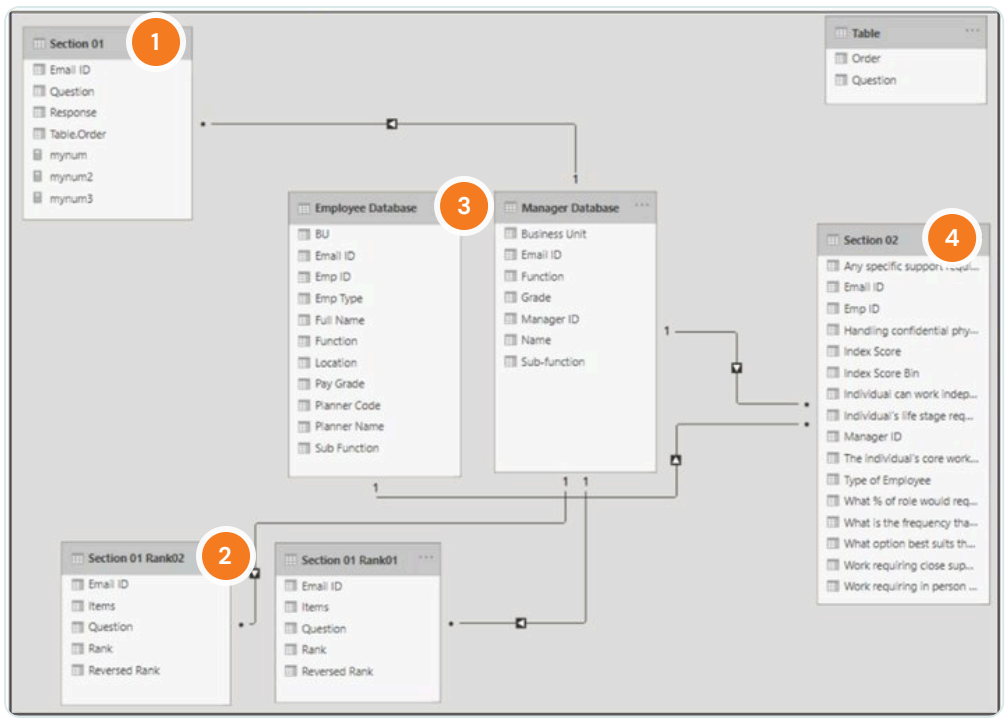

× weights →

ONE SCORE PER ROLE
Remote-readiness index
Weighted blend of F1–F5, scored 1 to 5
1.40 – 5.00
range across roles · average 3.77
Binned, then sliced by BU, function, sub-function, grade, location and life stage
Power Query: 5 conditional columns + custom weights

Each answer is reverse- or forward-scored so 5 always means "can work remotely". Weighting follows the Power Query "custom column weights" step; exact weights not published.

03 The pipeline, as delivered

Power BI data model from the original process map

1. **Section 01 · manager views.** Responses cleaned, nulls and file extensions removed, merged with the question-order table.
2. **Ranking tables.** Ranked answers filtered, split by delimiter, unpivoted and reverse-ranked, so "rank the options" becomes analysable rows instead of one cell.
3. **Employee and manager databases.** Columns trimmed and titles removed from names; they supply BU, function, grade, location and life stage.
4. **Section 02 · role assessment.** Merged with both databases, five conditional columns, custom weights, FTE vs off-roll flag, then index score binning.

CONSOLIDATION MACRO · BEFORE POWER BI
Loop through all files → Unprotect sheet → Shift first row, add headers → Rename by email ID → Save to disk

SURVEY FORM · AT THE POINT OF ENTRY
Personal login → Unique ranks enforced → All questions filled → Guided save and mail to HR

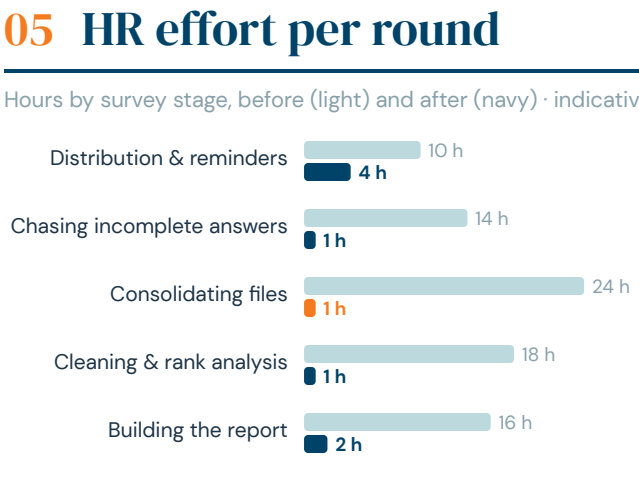

04 Four pain points, four fixes

Before → after

BEFORE	BEFORE	BEFORE	BEFORE
Messy input	**Many separate files**	**Opinions, not scores**	**One pivot per question**
Free-form replies, missing answers and tied ranks.	Each manager returned a protected workbook, copied by hand into one sheet.	Each manager's view of a role stood alone; rankings sat in one cell.	Every new cut meant another table, and the decision leaned on preference.
EXCEL VBA FORM	CONSOLIDATION MACRO	POWER QUERY	POWER BI · DAX
AFTER	AFTER	AFTER	AFTER
Clean at submit	**One click**	**Weighted 1–5 index**	**Every cut, one view**
Validated form: every question filled, every rank unique.	The macro loops through every returned file in one run.	Ranks split, unpivoted and reverse-scored; one index for every role.	BU, function, grade, location and life stage on one dashboard.

05 HR effort per round

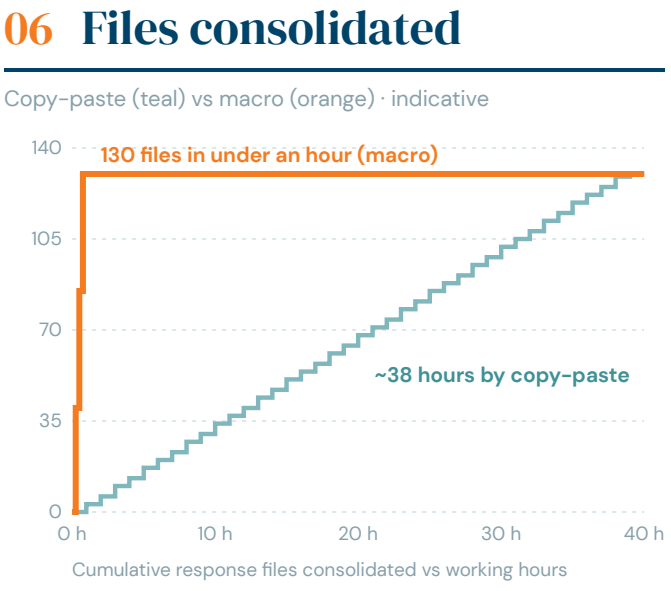

Hours by survey stage, before (light) and after (navy) · indicative

~~82~~ → 9 hours of HR effort per survey round

06 Files consolidated

Copy-paste (teal) vs macro (orange) · indicative

Cumulative response files consolidated vs working hours

07 How HMC ran it

1 week	**Discover** Three options, the factors that tie a role to the office, and the cuts leadership needed.
1 week	**Design** Two sections: manager views, plus each role scored on five factors.
2 weeks	**Build** VBA survey workbook, consolidation macro, Power BI report.
1 window	**Adopt** Personal passwords by email; HR dropped returns in one folder and ran the macro.
∞ ongoing	**Scale** Same pipeline reusable for future pulse surveys.

What any HR team can borrow

01 Assess roles, not just preferences
Asking managers what each role needs gave a defensible basis for who works where.

02 Validate at the point of entry
Unique ranks and complete answers at submit time removed most of the cleaning later.

03 Make the score transparent
Five named factors and visible weights let leadership see, and challenge, how the index works.
